Introduction: A Glimpse into the Past

In 1937, the landscape of cancer treatment was drastically different from what we know today. Diagnosis relied heavily on physical examinations and basic imaging techniques. Treatment options were limited, primarily involving surgery, radiation therapy (often delivered with less precise technology), and rudimentary forms of chemotherapy. The survival rates for most cancers were significantly lower than they are now. This chapter sets the stage, highlighting the stark contrast between the medical realities of 1937 and the advanced treatments available in the 21st century. It emphasizes the importance of understanding this historical context to fully appreciate the progress that has been made in cancer research and care. The era's prevailing attitudes towards cancer - often characterized by fatalism and a lack of widespread public awareness - will also be explored.
